

Great Lakes Activity Key

*** For ease of use during class, the teacher key pages are numbered the same as the student book pages ***

I. Introduction

The Great Lakes were carved out of the earth by glaciers during the last ice age - about 20,000 years ago. They have a tremendous impact on many people's lives and health. The Great Lakes ecosystem is constantly exposed to new imbalances imposed by humans. The lakes serve as transportation for ship and barge traffic. The ships and barges often carry animals and plants from other places into the lakes. Many cities and farms border the lakes. Fertilizers and weed killers get into the lakes by running off from these farms and cities. The water quality of the lakes is directly affected by human activities. Because the lakes are so large, they have a significant impact on local weather.

Get Info Objectives

1. Name the Great Lakes.
2. Determine the distance from student's residence to the Great Lakes.
3. Define "alien" (introduced) species.

Gather Data Objectives

1. Interpret color coded maps of Great Lakes data.
2. Graph monthly rainfall data obtained from a chart.
3. Determine the effects that imported species have on native animal and plant populations.

Application Objectives

1. Determine the relationship between the length of time wind has blown over water and the height of waves.
2. Write a paragraph describing Zebra mussels' economic influences.
3. Determine steps necessary to ensure the recovery of the Great Lakes' ecosystems.

- From the main screen, click "Get Info".

II. Get Info

A. Names

1. Label the six Great Lakes in the picture below.

- Click on the Names site to check your answers
- Click "Back" in the top bar of your web browser until you get back to the OAR Great Lakes Get Info site.

B. Location

- Use a ruler and the map scale to measure distance.

1. Draw a straight line from your city to the intersection (meeting place) of lakes Superior, Michigan, and Huron.
2. About how many kilometers are the Great Lakes from your house? answers will vary
3. How far from you are the Great Lakes in miles?
One mile = 1.6 km.

$$\frac{\text{\# km from home}}{1} \times \frac{1 \text{ mile}}{1.6 \text{ km}} = \underline{\hspace{2cm}} \text{ miles}$$

(answers will vary)

C. Alien Introductions

- Click on the "Foreign Species" site.
- Scroll down to the "Species Introductions" section.
- Read the section and answer the following questions.

1. What do you think an "alien" or "foreign" species is?

A species introduced to a new area where it isn't found naturally.

2. What are some beneficial (helpful) effects on an area when an animal or plant from another area is introduced?

Provide food, game, beauty, control pests

3. What are some harmful effects on an area when an animal or plant from another area is introduced?

Compete with native species for food, habitat, prey on

native species, bring diseases, introduce parasites.

- Click "Back" until you get back to the OAR Great Lakes main screen.
- Click "Gather Data".

III. Gather Data

A. Wind Speed on Lake Erie

- Click on the "Wind Speed" site.

1. Predict which areas of Lake Erie will have the highest waves. Record your answer as a written description of the location relative to other parts of the lake.

The northern part of the northeastern part of the lake

will have the highest waves. This part is just south of a

small peninsula.

2. Draw the area of highest waves on the map of Lake Erie.

3. Why do you think these areas will have the highest waves?

The winds are highest in this area, so the waves should be
highest here also.

4. Convert the highest wind speed from knots to miles per hour.
 (One knot is 1.15 miles per hour.)

$$\frac{25 \text{ knots}}{1} \times \frac{1.15 \text{ mph}}{\text{knot}} = 28.75 \text{ mph}$$

- Click "Back" until you get back to the OAR Great Lakes Gather Data site.

B. Wave Height on Lake Erie

- Click on the "Wave Height" site.

1. Check your prediction in #1 above. Was your prediction correct?

yes or no

2. How many feet high are the highest waves on Lake Erie?
(one foot = 12 inches, one meter = 100 cm, one inch = 2.54 cm)

$$\frac{2.5 \text{ meters}}{1} \times \frac{100 \text{ cm}}{\text{meter}} \times \frac{1 \text{ inch}}{2.54 \text{ cm}} \times \frac{1 \text{ foot}}{12 \text{ inches}} = 8.2 \text{ feet}$$

- Click "Back" until you get back to the OAR Great Lakes Gather Data site.

C. Water Elevation

- Click on the "Water Elevation" site.
- This map uses elevation like a topographic map. Elevation means height above sea level. Higher elevations are higher above sea level.

1. What part of Lake Erie has the highest water elevation?

The northeast corner of the lake has the highest elevation.

2. What part of Lake Erie has the lowest water elevation?

The southwest corner has the lowest elevation.

3. What is the direction of water flow in Lake Erie?

from the northeast to the southwest.

4. What is the total difference in water elevation from the northeast end of Lake Erie to the southwest end?

0.40 meters

- Click "Back" until you get back to the OAR Great Lakes Gather Data site.
- Click "Forward" at the bottom of the screen.

D. Graphing Overland Precipitation

- Click on the "Lake Erie Precipitation" site.

1. Graph the precipitation during 1900.

- Click "Back" until you get back to the OAR Great Lakes Gather Data site.

E. Temperature Changes with Depth

- Click on the "Lake Ontario Vertical Temperature" site.
- This map shows you the water temperature at various depths of Lake Ontario. The picture in the right lower corner shows the whole lake with lines drawn where the four cross sections are taken.

1. What is the coldest water temperature in Lake Ontario? 2 °C
2. What is the range of depth at which the water is 8 degrees Celsius at cross section "C"?

55 meters to 132 meters

- Click "Back" until you get back to the OAR Great Lakes site.

F. Effects of Foreign Species on Local Animals

- Click on the "Health Indicator" site.
- Read the site and answer the following questions.

1. How is the "health" of Lake Michigan's water life populations measured?

Many amphipods in the lake mud indicates a healthy lake.

2. Why does the lack of amphipods affect the fish population?

Fish eat amphipods.

3. What do amphipods eat?

Amphipods eat diatoms.

4. Why do you think the amphipods are disappearing?

Zebra mussels are eating the diatoms and are better at it, so

there are not enough diatoms to feed the amphipods.

- Click on the "amphipods" hot text in the site.
- Scroll down to the blue and white maps of the Diporeia population in Lake Michigan.

5. When you compare the maps from different years, what can you infer (figure out) about amphipods' population?

The diporeia population is decreasing.

6. Why is it important to measure seemingly unimportant things such as the number of invertebrates in the mud at the bottom of lakes?

Invertebrates can be very sensitive to small changes in the environment. If we monitor their health and populations, we can judge how healthy the environment is. Also, other animals including humans are poisoned by many of the same things that kill invertebrates.

7. How do scientists make maps like these?

Measure the population of animals in an area over time. Assign a specific number of animals to be a certain color. Draw colors on the map to represent the number of animals.

- Click "Back" until you get back to the OAR Great Lakes Gather Data site.

G. Zebra Mussels - A Closer Look

- Click on the "Zebra Mussel" site.
- Read paragraphs 1, 2 and 4 of the "Impacts" section.

1. What problems are caused by Zebra Mussels?

biofouling (living things fouling things up), increase drag on

boats, sinking navigational buoys, fouling fishing gear,

deteriorating dock pilings, corroding steel, and concrete

structures.

2. What good things have happened due to Zebra mussels?

Lake Erie's water is clearer than it used to be. More plants

grow in Lake Erie since they can get more sunlight. The

plants provide cover and act as nurseries for some species

of fish.

- Read the "Methods of Control" section.

3. List the three methods of control you think are best. Write why you think these are the best methods.

Method

Methods chosen will vary.

All methods are listed here:

1. chemical molluscicides including chlorine, chlorine dioxide
2. annual removal with high pressure washing / scraping them off
3. dewatering / desiccation (freezing or heating)
4. thermal (steam or hot water)
5. acoustical vibration
6. electric current
7. filters, screens
8. toxic coatings such as copper and zinc
9. non-toxic coatings such as Teflon
10. CO² injection
11. UV light
12. anoxia / hypoxia
13. flushing
14. biological agents (parasites, predators, diseases)

Why it is good

Reasons will vary

- Click "Back" until you get back to the OAR Great Lakes Gather Data site.

- Click on the "Zebra Mussels Biofouling" site to see examples of Zebra mussels biofouling and living on other mussels.

This picture show how zebra mussels can block water pipes.

- Click the "Next slide" button.

This picture shows how zebra mussels live on and kill native mussels.

- Click "Back" until you get back to the OAR Great Lakes main screen.

- Click "Application".

IV. Application

A. Wind Duration vs. Wave Height

- If you have done the Forecasting activity, skip the boxed wind barb section below.

- Go to the University of Illinois at Urbana-Champaign
WW2010 Project Wind Barb site below.
<http://ww2010.atmos.uiuc.edu/guides/maps/sfcobs/wnd.rxml>

- Read pages 1 through 3. Once you understand how wind
barbs work, click "Back" until you get back to the OAR
Great Lakes site and continue with this activity.

- Click on the "All Lakes Wind" site.
- If you have a color printer, print the map using the "Best" quality.
- A grayscale printer will not provide a useable image.

1. Describe both the direction of wind and the speed of wind on
Lake Michigan. What is the overall pattern of wind speed and
direction on the lake?

The wind is out of the north at about 10 knots except in

the middle west and extreme south, where it is about 20

knots.

2. Describe the wind speed in different locations on Lake Michigan.

The wind speed is about the same over the lake.

- Click "Back" until you get back to the OAR Great Lakes Application site.
- Click on the "All Lakes Wave Height" site.
- If you have a color printer, print the map using the "Best" quality.
- A grayscale printer will not provide a usable image.
- If you don't have a color printer, enter the following URL.
<ftp://superior.eng.ohio-state.edu/pub/ncaster/allakes/97/w9711212.gif>
- Click the "Back" and "Forward" buttons on the web browser to move between the pictures if you want to.

3. Describe the wave height in different parts of Lake Michigan.
What is the overall pattern of wave height?

The height of the waves increases toward the southern part
of the lake.

4. What is the relationship between the length of time the wind blows over water and the height of the waves produced?

The longer the wind blows, the higher the waves are.

- Click "Back" until you get back to the OAR Great Lakes Application site.

B. Economic Impacts

1. Think about the harmful and beneficial effects of Zebra mussels. What are some ways Zebra mussels are economically important?

They foul pipes and damage industrial and power facilities.

They cause drag on barges and ships. They affect fish and

invertebrate populations, but they might actually do some

good to some fish species. They create jobs for people who

clean boat hulls and replace pipes.

- Click "Forward" at the bottom of the screen.

C. Progress

The Great Lakes border not only the US, but also Canada. The water quality of the lakes affects both countries. We have to work together to provide a future for the lakes and the people who live on them. Both countries signed an agreement called "The Great Lakes Water Quality Agreement" that has helped us clean up the lakes. The Canadians have designed a site called the Great Lakes Atlas that has lots of useful and interesting information on the lakes. You can find the URL in the Related Web Sites section at the end of the activity. This section uses parts of their Great Lakes Information Management Resource site.

- Click on the "State of the Lakes" site.

1. Overall, which lake had the highest concentration of phosphorus in 1991/92?

Lake Ontario had the highest concentration

2. Which lake had the highest concentration of PCB's in fish?

Lake Michigan had a PCB concentration of 23 ppm.

3. Which lake had the highest concentration of PCB's in gull eggs?

Lake Ontario had a PCB concentration of 180 ppm.

4. Which lake had the second highest concentration of PCB's in gull eggs?

Lake Michigan had a PCB concentration of 160 ppm.

5. Compare the small inset map in the upper right corner to the larger map. Which areas show the greatest improvement between 1983 and 1991?

Lake Ontario shows the greatest drop in Phosphorus concentration.

6. What does the graph of the PCB concentration at Mugg's Island show is happening over time?

The PCB concentration in gulls' eggs is dropping steadily.

7. What do you think caused the trend in question 4 above?

The PCBs are not used any more, and the PCB that is present
is being diluted, washed away, and degraded.

- Click "Back" until you get back to the OAR Great Lakes Application site.
- Click "Forward" at the bottom of the screen.

D. Long-Term Recovery

- Click on the "Great Lakes' Future" site.
- Read from "The Future of the Great Lakes" section to the bottom of the site.

1. What can we do to ensure the recovery of the Great Lakes' ecosystems?

regulate toxic waste; control waste disposal; control pesticide

and fertilizer use; understand living resources of the Great

Lakes better; protect wetlands, forests, and shorelines better;

and rehabilitate degraded waste.

2. How can we use maps of populations to help understand the living resources in the Great Lakes?

Maps of animal and plant populations can show us trends over

time that could affect the environment.

- Click "Back" until you get back to the OAR Great Lakes main screen.
- Click "Enrichment".

V. Enrichment Activities

A. Interviews

1. Interview a meteorologist about the specific weather conditions that are caused by the Great Lakes, especially in winter.
2. Talk with someone who has gone ice fishing and ask about what is caught, when is the best time to go, and what is used for bait.

B. Newspaper Activities

1. Using the weather section or map, keep a record of the daily temperatures or snowfall at cities around the Great Lakes vs. cities inland. What is the difference between inland and coastal cities' temperatures and rainfall?
2. Collect news articles related to the health of the Great Lakes and summarize each article.

C. Research

1. Write a short report on how the Great Lakes formed. Include when they were formed, how they were formed, how long it took, and a diagram of what happened.
2. Find out who was the first European to see the Great Lakes.
3. Using a map, list all the major cities and their populations that border the Great Lakes. Add the total population of the cities.
4. Research Native American tribes that lived in the Great Lakes area.

- 
5. Find out what industries are supported by the Great Lakes.
 6. Find out why Chicago is called "The Windy City".
 7. Research diatoms and find out what they are used for.
- Click "Forward" at the bottom of the screen.
